

# Tracking Efficiency in $Z \rightarrow ee$

- Axial only CFT tracks
  - a lot of people worked hard to fit them into the d0reco
- Efficiency:
- p13.01
  - 3D: gtr+ htf
  - 2D: gtr (chunk 113)
- patched p13
  - 3D: gtr + patched htf
  - 2D: gtr (chunk 113)
- plans

# Axial Only tracks

- Present only in data path
- $Z_{DCA} = tg \lambda = 0$
- Vertex code filters them by requiring at least on SMT hit on a track
- ChargedParticle assigns  $tg \lambda = 1000$  (and some non-zero errors on it and  $Z_{DCA}$ )
- Physics objects are not affected since they match tracks to other subdetectors in eta-phi

# Sample and Track matching

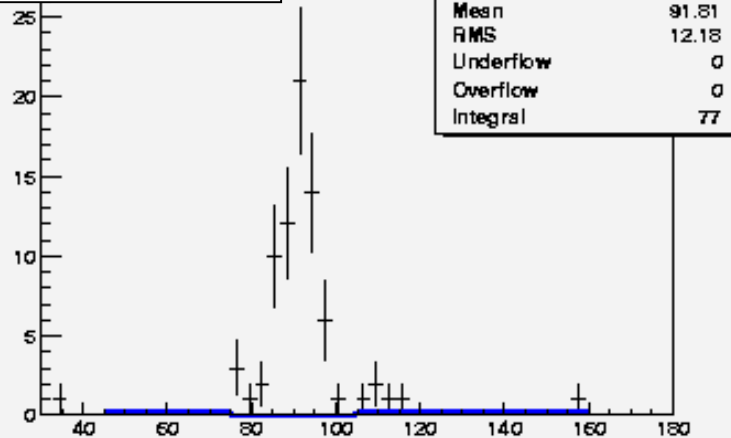

- CC-CC Z events from April to August, picked with calorimeter information
- pT correction: if no SMT hits, correct pT using DCA (as in p10.15 for ICHEP data)
- Match:
  - $\Delta(\varphi_{\text{EM}}, \varphi_{\text{track}}) < 50 \text{ mrad}$
  - $pT > 5, 15 \text{ GeV}$
- “Fake” match:
  - $\Delta(\varphi_{\text{EM}} + \pi/2, \varphi_{\text{track}}) < 50 \text{ mrad}$
  - $pT > 5, 15 \text{ GeV}$

## ● Efficiency

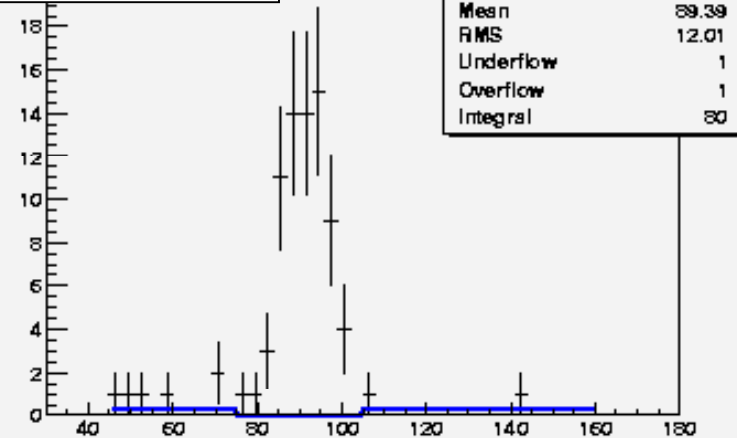

$$\mathcal{E}_{\text{track}} = \frac{2 \cdot N_2 + N_1}{2 \cdot (N_2 + N_1 + N_0)}$$

# p13

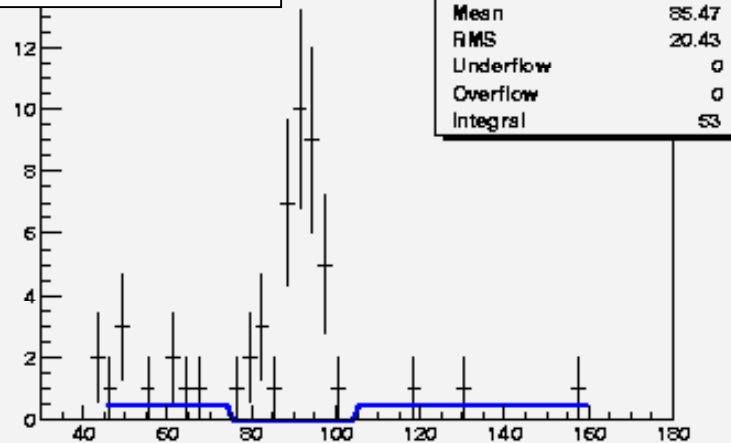

Two matches

One match

# Efficiency

	3D tracks, pT>15GeV	3D tracks, pT> 5GeV	2D tracks, pT>15GeV	2D tracks, pT> 5GeV
p13	59.7± 3.0	62.9± 3.0	86.2± 2.3	92.6± 1.9
p13 patched HTF	71.1± 2.8	74.8± 2.7	87.4± 2.1	93.0± 1.8
p13 patched HTF FAKES	0.4 ± 0.2	1.1 ± 0.5	0.4 ± 0.2	1.7 ± 0.7

# Summary

- Axial tracks proved to be quite useful for analyses with high pT electrons and photons:
  - $P(e \rightarrow \gamma) = 0.069 \pm 0.018$
  - $P(\gamma \rightarrow e) = 0.017 \pm 0.007$
- May be useful for analysis of stereo inefficiencies
- There seems to be a drop in efficiency from p11 TARC to p13...
